HOMEWORK AND MINORITY STUDENTS IN DIFFICULTIES WITH LEARNING MATHEMATICS: THE INFLUENCE OF PUBLIC DISCOURSE

Troels Lange
Aalborg University, Denmark

In this paper, I contrast an immigrant 10 year old girl’s perception of her home support and her mathematics teacher’s rather different perception. According to the girl, her big sister who is in Year-10 helps her with her homework in mathematics. However, the teacher believes that she has no support from home. I show how the girl tries to align her perception of her home support with middle class Danish family values, and how the public discourse about immigrants apparently frames the teacher’s perception of the resources that are available or not available to the girl. The analysis becomes an example of how mathematics teaching and learning is embedded in a wider socio-political field. On one hand, the analysis illustrates that the family resources called upon by homework are very differentially available to children with different backgrounds. On the other hand, it suggests that sometimes resources could be available that schools do not see because students are constructed as disadvantaged.

INTRODUCTION

In recent years, immigrant [1] students’ school performances have become subject of concern among politicians, administrators, school authorities etc. as evidenced by the follow up report Where immigrant students succeed (OECD, 2006) on the PISA 2003 survey (OECD, 2004) that investigated immigrant students specifically. In many of the participating countries, the average performances of immigrant students were lower, often much lower, than native students. In the case of Denmark, the report showed that immigrant students performed poorly academically. Similar to many other countries, the differences in performance between immigrant and native students could only partly be explained by differences in the socio-economic background of the students including the educational background of their parents. Taken as a group, minority students in Denmark can be seen as under-achievers (Holmen, 2008). The explanation for this underachievement accepted by politicians and bureaucrats determines how it is dealt with. In 2007, a national survey attributed this lower performance in large part to communication patterns and cultural capital of the immigrant families (Rockwool Fondens Forskningsenhed, 2007a). Consequently, the educational policy can be seen as drawing upon a notion of deficiency of the immigrant students and their families with respect to linguistic mastery of Danish and integration in Danish culture (Holmen, 2008).

National PISA surveys, PISA København-2004 (Egelund & Rangvid, 2005) and PISA Etnisk 2005 (Egelund, Jensen, & Tranæs, 2007) detailed the picture of the school
performances of immigrant students of non-Western origin. It was found that the average performance of immigrant students in reading, mathematics and science was alarmingly poor, worse than expected, and much lower than the average of their fellow native students. Again, the difference could not be fully explained by the generally lower socio-economic circumstances and educational background of the immigrant population compared to the native population. The latter report found that neither could the differences be related to school conditions. Rather, the explanation largely was to be found in the students’ home culture. A newsletter addressing the public illustrates the tone of the message:

The picture is quite clear: It is of little use to look at the schools if you shall find explanations to the relatively weak reading skills among young bilingual. /... [The survey] shows that it is decisive which other language [than Danish] a bilingual student speaks at home. Those who speak Arabic with their parents have a tremendous tendency to lack reading skills … The situation is completely different if you speak Punjabi or Urdu … (Rockwool Fondens Forskningsenhed, 2007a, p. 5)

It was found, that family support for homework was five times higher in native Danish families than in immigrant families. Similarly, the levels “social communication” was found to be three times higher and “cultural communication” ten times higher. The parents’ income, taken to signify their level of integration in the labour market, also had a great impact on the immigrant students’ school performances (Rockwool Fondens Forskningsenhed, 2007a).

The report was given wide attention in the media. The minister of education was “worried”, repeated the measures already taken by the government addressing the issues, and promised his support to the local authorities (Rockwool Fondens Forskningsenhed, 2007a). The educational spokesperson of the Social Democratic Party (the leading opposition party at the time) concluded that the necessary actions had to start with the parents in the children's homes. Without crossing the threshold of private life, it would not be possible to deal effectively with the problem. The parents had to have a job and become integrated in the Danish society via the labour market. The children had to be “integrated” in the family, the meaning of which was explained as follows.

What does it mean that children are integrated in the family. It is homes where children are talked to and not at [2]. It is homes where the parents support the children in their schoolwork with homework. It is homes where you are interested in what each other do and ask after big and small things that have happened during the day, and what you have experienced and thought. And it is homes where the family go on trips together, visit museums, talk about the events of the day on television, the new movies etc. On all the circumstances there is a marked difference in bilingual families and in Danish families. (Rockwool Fondens Forskningsenhed, 2007a, p. 14; my translation, italics in original).

A well-respected principal at an inner Copenhagen school with a high proportion of immigrant students agreed to the importance of the communication in the families.
The biggest gap between the Danish and the ethnic children's achievements is in science and that is no surprise, because it is here that it “works through” that there is no conversation culture in most of the ethnic homes.

… We must work harder to get the necessary close contact with the families so that we can get the parents to understand how important it is that both mum and dad talk to their children, take interest in their schooling, attend the meetings at the school, ask about the children's well-being etc.

… This survey confirms my contention of the great importance of the dining table! Here it is seen that it is the very way you talk in typical Danish families and in typical ethnic families, that is the “cultural communication”, which is ten times higher in a Danish than a in an ethnic family, and here I think, that that is connected with the dining table you gather around every evening versus the individual eating at the coffee table in the ethnic families. (Rockwool Fondens Forskningsenhed, 2007a, p. 17; my translation, quotation marks in original)

In these two quotations, it is seen that the idea that immigrant students low school performance was to be explained with reference to presumably cultural features specific of immigrant families was readily accepted. It seemed to resonate strongly with existing presumptions and lent itself easily to further elaboration.

**HOMEWORK**

Mathematics education is a complex social practice (Valero, 2002) of which homework is a part. Homework is a central “meeting place” for school and home. School culture, values, norms and expectations meet with home ditto and resources with the student/child as the meeting ground (student at school, child at home).

Quantitative studies report little effect of homework on students’ achievement in elementary school (Inglis, 2005). Nonetheless homework is recommended with the purpose of fostering “positive attitudes, habits, and character traits; permit appropriate parent involvement; and reinforce learning of simple skills introduced in class.” (Marzano & Pickering, 2006; Grade Level section; with reference to Cooper, 2007). As the quote illustrates, talk about homework is often embedded in a moralistic language, which takes certain values as givens, in this case what is seen as positive and appropriate. It hides the fact that assigning of homework also is exertion of teacher power over students, a way of controlling students’ behaviour in and out of school time, and a way of asserting school norms and values. Some students think of homework as appropriating their free time and scope (Lange, 2008). The actual contexts in which children manage their homework are very different, and homework interacts in complex and differential ways with the students’ dispositions and social contexts:

How [homework] is done is more important than that it is done, because the how will make the difference between supporting children’s learning and facilitating the collaboration of their parents, or it becoming yet another element in an education system in which the benefits are differentially available, according to socio-economic class,
Homework assignments affect the relationship between children and parents. Bratton, Civil and Quintos (2005) found this relationship was affected even more when the parents were not fluent in the majority language as shown by the case of Mexican immigrant in USA. Abreu and Cline (2007) argue that children from low socio-economic background develop awareness of the different social valorizations of school culture and their home culture with its mathematical practices.

Valero (2007) discusses how advantaged and disadvantaged positions for participation in mathematics education practices are constructed. In a similar manner, I show how a 10 year old girl tries to align her perception of her home support with middle class Danish family values, and how the public discourse about immigrants apparently frames the teacher’s perception of the resources that are available or not available to the girl. The analysis becomes an example of how mathematics teaching and learning is embedded in a wider socio-political field. On one hand, the analysis illustrates that the family resources called upon by homework are very differentially available to children with different backgrounds. On the other hand, it suggests that sometimes resources could be available that schools do not see because students are constructed as disadvantaged.

METHODOLOGY

This paper is part of a larger study aimed at exploring students’ perspectives on mathematics learning in general and in particular from their experiences of being in difficulties with learning mathematics (Lange, 2007). The empirical material produced in this study is interviews with children aged 10 or 11 years and observations of their mathematics classes. The children were students in a Year 4 class in a Danish Folkeskole, i.e. a public school. There were twenty students in the class with equal numbers of boys and girls as well as an equal number of what the children referred to as Arabs or Danes. All of them were born in Denmark and spoke fluent Danish. However, the Arabs were descendents of parents emigrated from the Middle East.

The mathematics lessons of the class were observed for almost a complete school year on a more or less weekly basis. Three rounds of interviews were conducted. In the first all students but one were interviewed in groups of six or seven students. In the second, approximately half of the students were interviewed in pairs or alone. Half of the students were also interviewed in pairs in the third round. Some students took part in both the second and third round. The interviews lasted from 30 to 45 minutes and were audio recorded; the group interviews were video recorded as well. The students’ mathematics’ teacher was interviewed in the third round of interviews.

The interviews were semi-structured qualitative research interviews that aimed to explore and understand the experiences and life world of students in relation to school
mathematics teaching and learning (Kvale, 1996; Goodson, 2005; Goodson & Sikes, 2001). Students that appeared to me to be low performing in school mathematics were generally the ones asked to participate in the pair and single interviews. I assumed that low performing students would possess interesting and valuable insights into school mathematics education (see Lange, 2007).

In this paper, I will interpret excerpts from three interviews: a single interview with the student in the second round; a paired interview that included this student in the third round; and the interview with the mathematics teacher, also in the third round. Observations and other interviews inform the choice of excerpts and interpretations but are not analysed in this context.

In presenting transcripts, two choices have been made. The first was to quote in some length, and the second to give the original Danish transcript together with a translation into English. The reason for the first choice concerns the difference between the researcher’s voice in a summary and the interviewee’s own voice (although filtered through a transcription). Goodson and Sikes (2001; ch. 3) discuss this issue and exemplify that in some cases the difference can be dramatic as to the impression the reader gets of the interviewees and their stories. As the interest in this research is on children’s perspectives on mathematics education, and as children of the age in question express themselves differently from adults, linguistically, grammatically and from a different perspective, it is important to render their ways of expressing themselves as a starting point of the interpretation.

The Danish transcript is given because that is what is analysed. The transcript is close to the wording of the recordings. As a translation that conveys the subtleties of a transcript of children’s spoken Danish into what could be a transcript of children’s spoken English is neither simple nor always possible, a rather literal translation has been chosen at the expense of what might be considered good English by native speakers of one of the versions of this language.

HOMEWORK SUPPORT

In many of the mathematics classes I observed, the teacher would assign the students to work on a number of problems and their homework would be what they did not finish in the lesson. This practice is very common and not specific to this particular teacher. All the same, it constructed homework as a sort of punishment for not being on task, quick, able, knowing what to do, listen to instruction, etc.

In the following, I will first present how Kalila perceives the support she gets at home for her homework, and how the teacher perceives it, and continue with Kalila’s perception of how her big sister helps her. The argument will be that the help Kalila receives from her sister seems appropriate. Second, I will present how the teacher perceives the language knowledge of the immigrant children and explain this with reference to patterns of communication in immigrant families. I will show how the teacher’s perception echoes explanations “floating around”. Third I will discuss how
both Kalila and the teacher can be seen as aligning with the conception of normality in the majority Danish culture.

In the first interview with Kalila, I asked her if somebody helped her with her homework. The transcript [3] gives the dialogue and shows the style of interviewing.

</table>

The transcript shows that Kalila’s big sister helps her with her homework (4-12; here and in the following, numbers in brackets refer to line numbers in the transcript). Her sister is in Year-10 or the gymnasium (upper secondary school) (13-14). Sometimes her father helps her (2, 10). In her family Kalila was the fourth of six children; her sister was the eldest of the siblings and being in her tenth school year she was probably 16-17 years old.

Kalila’s story about who is helping her with her homework developed from “it is my dad” (2) to “also my big sister” (4) to “mostly my big sister” (6) and ended with “you can pretty well say it is my big sister” (8) – with the addition that her father occasionally helped her (10). A discussion of how this may be aligning with
perceptions of the type of help she was supposed to get at home occurs in the final section of the paper.

In the interview with the mathematics teacher, I asked her to group the students in three groups according to their mathematical competence. Five of the seven children in the group with least competence were minority children. The teacher saw a clear connection to family support in that four of the five minority children in her view had little support to their school attendance. Kalila and another student had no support: “There is no backing, there is nothing at all”. The two other children had only little support: “If there is anybody that helps then it is often a big sister”.

The teacher’s general opinion seemed to be that parents should help their children with their homework and that big sisters were not appropriate helpers. She was apparently unaware that Kalila’s big sister was helping her. At 16 to 17 years old, the sister was a young adult and, contrary to Kalila’s parents, she had gone to school in Denmark and could be supposed to know the school culture and the social practices of mathematics education in the Danish Folkeskole much better than her parents did.

In a later interview with Kalila and Maha, she too an immigrant student, big sister help with homework was confirmed as normal practice. The girls contributed details about the form of help they received. The interview took place about the same time as the interview with the teacher quoted above.

Transcript 2. Interview with Kalila and Maha May 2007 (0:15:18-0:16:39)

15 Troels Er der nogen der hjælper dig med lektier der hjemme?
16 Kalila Ja
17 Maha Min storesøster
18 Troels Din storesøster ja
19 Kalila Altså ved mig er der, er det ikke hun laver det for mig men
20 Maha Nej. Hvis der nu er noget jeg ikke kan, altså den der (en opgave i deres lærebog) den forstod jeg ikke helt (nej ok) så forklarer min storesøster det (nå ok)
21 Kalila Altså for eksempel hvis nu tager vi for eksempel, hvis det var for eksempel to plus to for eksempel (ja ok) ja og så [siger] hun hvad er to plus to. Og der er mange regnestykker af dem (mm). Ikke _ fem plus fem. Og så prøver hun at forklare mig det så tager hun et stykke papir. "Du har to, og du plussere to mere” altså sådan to tre
22 Maha "Hvad er et plus et?"
23 Kalila Ja. Og så hvad er, hvis du skal sige et plus et, det ved jeg ikke. hvis jeg nu

Is there somebody that help you with your homework at home?
Yes
My big sister
Your big sister yes
You see by me is there, is it not she makes it for me but [she does not do it for me]
No. If there is something I cannot, that [a problem in the textbook] that I did not quite understand (no ok) then my big sister explains it (well ok)
For example now if we take for example, if it was for example two plus two (yes ok) yes and then she [says] what is two plus two. And there is many problems [of that sort?] (mm). Aren’t there _ five plus five. And then she tries to explain it to me so she takes a piece of paper. “You have two, and you plus two more” that is two three
“What is one plus one?”
Yes. And then what is, if you shall say one plus one, I don’t know that. If I
vidste det, det er to. "Så gør det to gange"). "Et plus et det er to"). "Et plus et det er to"). Så giver det jo fire. Så laver hun, så hjælper hun mig, med mig med det første og så andre og så har jeg forstået det

knew, it is two. “Then do it two times”. “One plus one that is two”. “One plus one that is two”. So that makes four. Then she makes, then she helps me, with me with the first and then the others and then I have understood it

So your big sisters they are like, they do like a teacher would do, it sounds. Is that right?

Yes

Yeah [hesitating a little?]

Yes mm yes

You see you see “two plus two what is that?” “It is four.” “Then you just write it down.”

An elder sister helps both Kalila and Maha with their homework (15-19) when they need it (20). The sisters explain the problems in the textbook (20) and ask them questions to make them understand (21-23) so that they can do the tasks by themselves (23).

To these two girls, big sister help was an established way of dealing with their homework. Their description indicated that their sisters attempted to activate knowledge relevant to the situation (21-23, 28) and thus took on a teacher-like approach (24-26). The sisters seemed to have reflected on their role as helper. Kalila had considered the kind of help she had from her sister. This can be seen when, on her own initiative, Kalila pointed out that her sister did not do her homework (19) but instead asked her questions to support her understanding (21, 23, 28). Thus, the support the girls got from their sisters seemed very similar to the support native Danish parents would give.

INFLUENCE OF PUBLIC DISCOURSE

As seen above, the teacher felt that Kalila received no support from her home. This raises the question about why the teacher did not recognise the resources actually present for Kalila in her family even if she did not think of big sisters as proper homework supporters. In this respect, the teacher’s general view on immigrant students is informative.

In the interview, the teacher said that the bilingual children’s knowledge of words and concepts was much less than the Danish children’s knowledge. She saw this as a consequence of communication patterns in the families.

And that is logical indeed because these words - generally I do not at all think that bilingual parents talk with their children as Danish parents do. They don’t get talked - they get talked at, but I don’t think they get talked to. That you sit down and say, “this is a blue car and the car says broom”. I don’t think - it is my feeling that it does not happen at all. [Interview with teacher, May 2007]
In other words, the teacher assumed that the communication between children and parents in immigrant families was less communicative and more directive compared to native Danish families. She further assumed that this led to immigrant children being less competent in academic Danish than native students were. Hence, the teacher endorsed the same explanation for immigrant students’ school performance as the report described in the introductory section (Rockwool Fondens Forskningsenhed, 2007a). The core of her argument (children getting *talked at* versus *talked to*) was the same phrasing as used by the spokesperson of the Social Democratic Party. Thus, the teacher’s perception was not her personal idiosyncratic construction of an explanation for her experiences as a teacher of immigrant students. Rather, her assertion can be interpreted as a voicing of the dominant public discourse at the time. The image of immigrant families as deficient does not support an awareness of other possible resources, and this might explain why the teacher did not recognise them in the case of Kalila.

In the Danish PISA-reports the immigrant students are reported – on average – to get less help from their parents and to draw on a wider range of other resources, such as, siblings, friends, homework cafes, libraries, to support their homework compared to the native students (Egelund et al., 2007; Egelund & Rangvid, 2005). Kalila and Maha exemplify this. As often seen in immigrant families of non-Western origin there are more children in their families than usual in native Danish families. Being among the younger children in their family, they have somewhat older sibling that have gone to Danish school. The girls’ big sisters have gone to Danish primary, lower secondary, and perhaps upper secondary school. The teacher knew Maha’s big sister as a “bright and really intelligent” student. They thus seemed well qualified for helping their younger siblings because of their knowledge of Danish and familiarity with the implicated norms and values of the Danish *Folkeskole*. Compared to their parents, these sisters are likely to be better with academic Danish and insights into the social practices of Danish school mathematics. Hence, letting big sisters provide homework support for younger siblings could be seen as a sensible and responsible disposition for immigrant families. As argued above in the case of Kalila and Maha, the help thus provided seemed appropriate.

**NORMALITY AND DIFFICULTIES**

The dominant discourse explaining non-Western immigrant students’ academic performances by deficiencies in their families and normalising parental support for homework seemed to affect Kalila as well as the teacher. To the teacher the discourse corresponded to and allowed the expression of her frustrating experiences with immigrant students. It also seemed to make her overlook resources actually available to some students like the apparently competent sisters of Kalila and Maha.

For Kalila, the public discourse could have resulted in non-recognition of the support her family provided for her. She tried to position herself as “normal” by telling a story of her father helping her. A possible interpretation is that Kalila had perceived
the Danish majority definition of proper homework support and that she tried to position herself as normal in this respect. She aligned her perception of homework support with the dominant discourse, which did not recognise and valorise her actual support. Instead, it constructed her parents as inadequate because they did not personally help her with homework.

My observations suggested that it was not easy for Kalila to learn school mathematics. She struggled and she was rarely successful. It seems reasonable to contend that recognition of her home support may have been useful in providing her with extra support. This would be the argument for an inclusion perspective, which implies moving the focus from shortcomings of individual students to structures, attitudes, social and pedagogical practices that hinder students’ participation in the school and learning community (Booth, Ainscow, Baltzer, & Tetler, 2004). A recent evaluation of the education of bilingual students in the Danish Folkeskole recommended schools to reorganise and develop their practices to better include immigrant students (Danmarks Evalueringssinstitut, 2007). Other researchers criticised the PISA Etnisk report for tacitly assuming that the school is a culturally and socially neutral space. The demands made on families are culturally dependent and require a certain normality to fulfil. The school as an institution tend to recognise “white” middle class children’s experiences and overlook the experiences of immigrant children (Gilliam & Gitz-Johansen, 2007).

Becoming aware of the mechanisms by which immigrant students are constructed as disadvantaged could open up the development of practices that better facilitated immigrant students’ learning of mathematics. As the learning outcome of homework is contested and hits students very differentially, a serious reconsideration of homework as a pedagogical practice seems to be justified. However, reconstructing discourses about immigrants and homework is the responsibility of governments, politicians, school authorities, and the public and not the sole responsibility of individual teachers.

AFTERWORD

Four months after the release of the PISA Etnisk report and erratum was announced. In had turned out that the conclusion about the communication in immigrant families was incorrect. Instead, the general picture was that Danish immigrant youth talked a little more with their parents than in an average OECD family, yet still less than in average native Danish families. Hence the main explanation for the immigrant students’ lower school performances was the immigrant parents’ on average weaker position as to education, income and labour market status (Rockwool Fondens Forskningsenhed, 2007b).
NOTES

1 The OECD terminology is used in the paper. “Native students or non-immigrant students: Students with at least one parent born in the country of assessment. … Immigrant students: This group includes both first-generation students and second-generation students … . First-generation students: Students born outside of the country of assessment whose parents are also foreign-born. Second-generation students: Students born in the country of assessment with foreign-born parents.” (OECD, 2006, p. 14; my italics)

This terminology correspond to that of the Danish Statistical Bureau (Danmarks Statistik, 2007). In Danish educational settings, the standard term is bilingual children, which is defined the Danish Folkeskole Act as “children who have another mother tongue than Danish, and who only by contact with the surrounding society, eventually through education of the school, learn Danish.” (FL § 4a, stk. 2, my translation)

2 The difference between the Danish expressions, ”tale med” and “tale til”, translated here to “talk to” and “talk at”, is that the first implicates dialogue whereas the second signals directive monologue.

When the Danish expression “tale med”, translated into “talk to”, is used to characterise communication implicates a dialogue

3 In the transcript small sounds or comments by the listening person are indicated by ( ), hyphens ( - ) signal pauses, commas that the speaker starts again on a sentence, underscore (_) inaudible words, and three dots (…) shows where bits of dialogue has been left out.
